

We at the Lafarge Bath Cement Manufacturing Plant found the experience with the Queen's TEAM program to be very beneficial. The project entailed a technical, economical, social, and legal assessment of the novel use of purpose grown, greenhouse gas neutral biomass fuel crops as a coal replacement in the manufacture of cement. The 6 students were very professional and met their deadlines. The quality of their report and the depth of work they undertook to produce this quality product exceeded our expectations. They asked a number of questions that, on their own, were very useful to us in thinking through the problem and potential solutions. We have used the information and design work that they developed in a number of follow up studies and reports. Altogether, we are very pleased that we worked with the Queen's TEAM program and we highly commend this program to others who may have challenging problems to overcome.
